Known bugs and problems

126476_PixelRule.tiff ¬

The following is a list of problems that I know of as of July 1993.   Note that I have no immediate plans to fix any of these.   I'm just listing them so we all know that they are known problems!

- 86117_paste.tiff ¬ Convert PICT provides only partial support for the opcodes 9A and 9B.   This translates to saying: any 16bit bitmap will not be converted (the App will abort the conversion and issue an error message) and some 32bit bitmaps may not convert either (if they don't convert, Convert PICT may crash).   These limitations, especially for the 32bit bitmaps, is largely due to a lack of adequate sample files and access to an appropriate Macintosh.   If you have a file that does not convert, send it to me!

- 197843_paste.tiff ¬   If a sub-menu (e.g. the Info submenu) is open when a conversion is started, the main menu may be dimmed, but the items of the sub-menu are not.

- 393402_paste.tiff ¬   Bitmaps might generate errors when displayed with a PS level 1 interpreter from an MS-DOS machine (and VMS?) due to a cleanup-assumption that lines are terminated with only one character.
