Subject: Some hopefully useful code snippets...

Two useful things I came up with over the last couple of weeks. Hope they help somebody.

/* HostPicker Method

Assumptions:

- * you have an instance variable named hostField where you store the hostname.
- *every hostname in every netinfo subdomain is accessible to your system.
- *add libni_s.a to your libraries in ProjectBuilder.
- *Connect a button to this and voila!
- */

- pickHostName:sender
{

```
id    thePanel = [NIOpenPanel new];
[thePanel setListTitle: "Machine Names"];
[thePanel setPanelTitle: "Machine Name Picker" ];

if ([thePanel runModal] == NX_OKTAG)
{
    const char *fullDomain = [thePanel directory];
    if (fullDomain && *fullDomain){
        [hostField setStringValue: (char *)fullDomain];
        //[self changeHostName:self];
        //optional, add this method if you want to trigger the change.
    }
}
return self;
}
```
