

NOTE

BARCHART

by Joe Freeman, NeXT Systems Engineer

This palette demonstrates how to use your custom UI objects with the DBKit. It illustrates in particular the DBCustomAssociation protocol which allows you to retrieve or set values to your database via a custom view object (here the ChartOfMatrix view). Note that instead of a custom UI object, you can also connect the nib's file owner to an attribute of your DBModule, and create a custom association in this way.
