

Q: In DBModeler, how do I describe a multiple-field unique key for an entity? If a single property serves as a unique key for a record—such as "employee id" might serve for an employees entity—I can select the Unique Key box in the DBModeler Inspector. But how do I create a multiple-field key for a "sales" entity in which to identify a sale uniquely, I have to look at seller, buyer, and date?

A: You may check the "Unique Key" box in as many properties of an entity as you like. This is interpreted as a multiple-field key.
