

Q: I am having a problem when I have only one record in a tableview. I cannot delete it using the DBModule method **deleteRecord:**. When I print out the generated SQL, I only see the following:

BEGIN TRANSACTION

COMMIT TRANSACTION

What's happening?

A: This is a bug introduced in Release 3.2. To work around this problem, you should send a **saveModifications** message to the DBRecordList which matches your DBModule to save the deletion to the database. For example, you can use the following code snippet as a wrapper around your delete method:

```
delete:sender
```

```
{  
[dbModule deleteRecord:sender];  
#ifdef BUG_WORKAROUND  
[[[dbModule rootFetchGroup] recordList] saveModifications];  
#endif  
return self;  
}
```

Note that this bug will be fixed in a future release, thus you may need to put a `#ifdef` around the workaround. Also, the same code snippet can run on Release 3.1 without any effect.
