

Q: Why can I no longer load the Sybase/Oracle adaptor after I run **make install** on my DBKit application?

A: The problem is that **make install** does a complete stripping of the executable to save space by default. In order to force Makefile to recognize that DBKit adaptors need to be dynamically loaded, you must add the following line to your **Makefile.postamble**:

```
APP_STRIP_OPTS = $(DYLD_APP_STRIP_OPTS)
```

See also `/NextDeveloper/Makefiles/apps/app.make` for a full description of the rules.
