Q: What is the Lexi font that is found in /NextLibrary/Fonts?   It doesn't seem to appear in any application's Font panel.

A: Lexi is a special font consisting of 6 special characters only used by Digital Webster.   It was created as a partial solution to Webster's typographic challenges: it contains glyphs that don't occur in the Symbol (or any other standard) font.   For example, it includes the schwa e (the mirrored e) symbol and the n with the tail (the ng sound).

The Lexi font mapping follows:

>   space = space
>   quoteright = high stress mark (for pronunciation)
>   comma = low stress mark
>   e = scwa e
>   n = n with a tail as in the pronunciation for sing.
>   u = ligatured ue
