Q: How do I convert a hostid into an Ethernet address?

A: Here is the code to decode a hostid:

```
main()
{
          long      hostid;
          long      en_address;

          hostid = gethostid();
          en_address = (hostid & 0xffffff) + 0x00000f000000;

          printf("hostid = 0x%x; en_address = 0x%x.\n", hostid, en_address);
}
```
