Q: How can I tell how much WindowServer memory my application is using?   Some Application Kit programs can use a significant number of windows and bitmaps, and the memory used in these cases isn't easy to trace.

A: Use ProcessMonitor.app located in /NextDeveloper/Apps.   This application allows you to measure and analyze your application's memory usage.   In particular, the Display Postscript Inspector shows the amount of backing store and virtual memory used by your Application.   A monitor panel displays this information in graphical form.   For further information please refer to the documentation in /NextLibrary/Documentation/NextDev/DevTools/09_ProcessMonitor/ProcessMonitor.rtfd (for Release 3) or /NextLibrary/Documentation/NextDev/DevTools/04_DevApps/ProcessMonitor.rtfd (for Release 2).
