Q: How do I display a new window I created programmatically?

A: If you allocate a window and initialize it with the **init** method, that window, by default, has display disabled.   When display is disabled, the window appears on-screen without a title and its contentView is white.   You must send it a **display** message to get things going (i.e., so that it draws itself properly). Simply sending it **orderFront**: is not sufficient.

If your window is allocated and initialized with the **initContent:style:backing:buttonMask:defer:** method, display is disabled only if the defer flag is set to NO.   If it's YES, the window looks fine when it gets the **orderFront**: message.
