Q: How do I restore a system to the default NetInfo set-up?

Q: How do I undo a machine that has been made a NetInfo Configuration Server?

A: You need to do three things: obtain a default NetInfo database, an original hostconfig file, and an original hosts file.   The following assumes you're running the C-Shell.

```
cd /etc/netinfo
foreach db (*.nidb)
          mv ${db} ${db}-old
end
cp -rp /usr/template/client/etc/netinfo/local.nidb .
cd ..
mv hostconfig hostconfig.old
mv hosts hosts.old
cp -p /usr/template/client/etc/hostconfig .
cp -p /usr/template/client/etc/hosts .
halt
```
DISCONNECT THE COMPUTER FROM THE NETWORK
REBOOT

NOTE that this is NOT sufficient for undoing a clone server! See ../NEXTSTEP/NetInfo/undoing_a_netinfo_clone_server.rtf for how to undo a clone configuration server.

Warning

Don't change any values in the *localhost* and *broadcasthost* entries in the machines directory of the local NetInfo domain. Don't edit the *localhost* address in /etc/hostsÐthe localhost address is reserved and is not to be altered.
