

# ReaderDomain

by Mai Nguyen, NeXT Developer Support Team

## Overview

This simple program shows how to generate a **.domain** file programmatically. You should also read the **SimpleReader** miniexample, which shows how to build a customized reader by subclassing `IXLanguageReader`.

As input to this program, you need to have some text representative of the language for which you are building the reader. In this example, the file `FrenchText` serves that purpose, even though it only contains some random French text. You can easily modify this program to feed in another kind of text for your own reader. Note that your Reader class definition needs to be included in this folder as well.

## Other References

See also the Indexing Kit Technical Documentation on `IXLanguageReader`, `IXAttributeReader`, and `IXAttributeParser`.

Valid for 3.1

## Change History

June 1993   Created for Release 3.1
