

# Julian

INHERITS FROM                      Object

WRITTEN BY                              Charles G. Bennett

Version 1.2, , This class is in the Public Domain. No guaranties are made to its usefulness or correctness.

## CLASS DESCRIPTION

The Julian Class is an Interface Builder Module to implement julian day functions.

## FEATURES

- Rich set of class methods allows you to treat Julian as a function library.
- Fractional Days supported for easy time tracking and comparison.
- Instance variable and methods allow you to create lists of dates.

## INSTANCE VARIABLES

*Declared in Julian*                      double                      julianDayVal

## METHOD TYPES

### Initialization

- (BOOL) initDay:::
- (BOOL) initDay::::::

### Archiving

- read:
- write:

### Converting to and from julian dates

- + (double) getCurrentDate
- + (double) julianDay:::
- + (double) julianDay::::::
- + (void) calendarDay:::
- (void) calendarDay::::::
- getCalendarDay:::
- getCalendarDay::::::
- (double) getJulianDay:
- setJulianDay:
- setJulianDay:::
- setJulianDay::::::

Testing for valid dates

+ (BOOL) validDay:::  
+ (BOOL) validDay::::::

misc

+ (void) getEasterDay:::  
+ (int) dow:::  
+ (int) doy:::  
+ (double) wkd:::

Internal Methods

None.

## CLASS METHODS

### **getCurrentDate**

+ (double) **getCurrentDate**

Returns the julian day for the current month, day, year, hour, min, and second.  
This routine calls the unix localTime function.

### **getCalendarDay:::**

- **getCalendarDay** :(int) day  
:(int) month  
:(int) year

Returns the calendar date for the instance variable .

### **getCalendarDay::::::**

- **getCalendarDay** :(int) day  
:(int) month  
:(int) year  
:(int) hour  
:(int) min  
:(int) sec

Returns the calendar date and time for the instance variable .

### **getEasterDay**

+ (void) **getEasterDay**:(int ) year  
:(int \*) day  
:(int \*) month

Returns the day and month of Easter. Valid for 1900-2099  
Submitted and written by kjell@oops.se (Kjell\_Nilsson).  
Thanks.

### **julianDay:::**

+ (double) **julianDay** :(int) day  
:(int) month  
:(int) year

Returns the julian day for the given month day and year;

**julianDay::::::**

+ (double) **julianDay** :(int) day  
:(int) month  
:(int) year  
:(int) hour  
:(int) min  
:(int) sec

Returns the julian day and fractional day for the given month, day, year, hour, min, and second.

**calendarDay::::**

+ (void) **calendarDay**:(double) julian  
:(int\*) day  
:(int\*) month  
:(int\*) year

Returns the month, day, and year for the given julian day.

**calendarDay:::::::**

+ (void) **calendarDay**:(double) julian  
:(int\*) day  
:(int\*) month  
:(int\*) year  
:(int\*) hour  
:(int\*) min  
:(int\*) sec

Returns the month, day, year, hour, minute, and second for the given julian day and fractional day.

**validDay:::**

+ (BOOL) **validDay**  
:(int) day  
:(int) month  
:(int) year

Returns YES if the day month and year are valid, NO otherwise.

**validDay:::::::**

+ (BOOL) **validDay**  
:(int) day  
:(int) month  
:(int) year  
:(int) hour  
:(int) min  
:(int) sec

This routine extends the testing to include hour, min and seconds.

**dow:**

- **read**

Reads the Julian instance variable from *stream*. A **read:** message is sent during unarchiving. You never invoke this method directly.

- **write:**

- **write:**(NXTypedStream \*)*stream*

Writes the Julian instance variable to *stream*. A **write:** message is sent during archiving. You never invoke this method directly.

- **getJulianDay**

- (double) **getJulianDay**

This method **returns** the value of the julian day instance variable.

- **setJulianDay:**

- (BOOL) **setJulianDay:**(double) day

This method **sets** the value of the julian day instance variable. **Caution!** Use this with care since this directly sets the instance variable. Always returns **YES**

- **setJulianDay:::**

- (BOOL) **setJulianDay**  
:(int) month  
:(int) day  
:(int) year

This method **sets** the value of the julian day instance variable. Using the month, day and year parameters. Returns **YES** if the date was valid, **NO** if not., and the instance variable is NOT changed

- **setJulianDay:::~:**

- (BOOL) **setJulianDay**  
:(int) month  
:(int) day  
:(int) year  
:(int) hour  
:(int) min  
:(int) sec

This method **sets** the value of the julian day instance variable. Using the month, day, year, hour, min, and sec parameters.

Returns **YES** if the date was valid, **NO** if not., and the instance variable is NOT changed

## CONSTANTS AND DEFINED TYPES

None.
