# Calendar.palette (v1.0)

Calendar.palette is a 3.0 InterfaceBuilder View palette for the Control subclass Calendar. Calendar is a simple UI widget for presenting and selecting dates in a calendar form.

## 876954\_PixelRule\_Gray.tiff ↵

### Important Files...

paste.tiff ↵ **Calendar.[hm]** is the class represented by the palette.

915741\_paste.tiff ↵ **CalendarInspector.[hm]** manages IB Attributes inspection of an instance of Calendar.

### Notes...

94310\_paste.tiff ↵ Calendar has been subclassed from Control in order to provide target/action manipulation via IB. If enabled, an action is sent to the target when a day is selected in the calendar. Calendar allows empty selection also resulting in an action send.

Currently, this is the only way to send an action. If you desire the action sent when other values are set (for example, the month is incremented), modify those methods to call the private method '\_sendActionToTarget'.

562716\_paste.tiff ↯ You will need to include Calendar.[hm] in any project that uses this palette (or use interface file and include object file Calendar.o in link (OTHER\_OFILES in preamble)).

28904\_paste.tiff ↯ Calendar is a fixed size View and in general, singular in purpose. Pardon its simple mindedness (it gets it from the author).
