

To create a new Image Integrator library, first open the Fetch catalog that contains the graphics to be included in the Image Integrator library. If the graphics are contained in more than one Fetch catalog, create a new library from one catalog, then later add the graphics found in the other catalogs. Select the desired items in the Fetch catalog, then choose Copy Reference from the Fetch Edit menu. The Copy Reference hierarchical menu allows the user to either just Include Text or Include Thumbnails and Text. Choose the desired type of information to be copied to the clipboard. Next go to QuarkXPress and select Open Image Integrator... from the QuarkXPress Utilities menu. When the dialog appears prompting the user to select an Image Library, click the New button. If Aldus Fetch item information is not present in the clipboard, Image Integrator creates an empty Image Library. If Aldus Fetch Item information is present in the clipboard, Image Integrator creates a new Image Library and imports the image information into the new Image Library.
