CU_HTML.DOT (Beta 2)

CU_HTML.DOT is a Microsoft Word for Windows 2.0 document template that allows users to create HTML documents inside Word in a WYSIWYG manner and generate a corresponding HTML file.

You can assign different formatting tags to the paragraphs by simply pointing and clicking. You can also insert inline GIF images and specify hyperlinks by choosing the target file from a dialog box. The inline GIF images will also appear in the Word document.

By using the template, you can create HTML documents with little knowledge on the HTML syntax. Existing word processor features such as spell checking, printing, cut & paste, macro automation, etc. can be used.
