

BmpView version 1.0 for Windows 95

BmpView allows you to go through your drives/directories and look at preview sized images of Bitmap's. Once you've found the Image you want, you can automatically have it loaded into a paint program of your choice which can edit Bitmap's.

Features:

- Supports Bitmaps that contain up to 256 colours.
- Fast, very fast. Even large Bitmaps will be displayed with very little pause.
- You can specify a Bitmap editor, such as MS Paintbrush. Once you've found the bitmap you were looking for with just one click of the mouse, you're inside your favorite paint program. (Select the File menu, and then Preferences to setup your options)

Bug notes:

(1) The drive/directory selection listbox does not allow you to select another drive once you have selected one. I have tried everything to fix this, but it seems there may be something wrong with MS's DlgDirList MFC call. I put in a "REFRESH" button which will refresh the drive/directory list box with just the drive names available on your system.

If you would like to contact me, you can do so via e-mail.

Send me your suggestions/problems, etc...Remember, I wrote this for Windows 95, maybe it works under NT. You should have at least the April 95 (M8) Beta release of Windows 95.

See ya, and thanks for taking the time out to have a look through this little program.
