

• Introduction •

AutoMenus is an extension/cdev which will automatically select your menus for you. With AutoMenus, you no longer have to click the mouse button more than once and your chances of accidentally selecting the wrong menu item is dramatically reduced.

AutoMenus 5.x includes some special features for use with System 7.

AutoMenus 5.3 requires System Software 6.0.4 or later to function. It will not load with earlier versions.
