1.1 No title

Sufferer

What~is~it? What this program does...

Usage How to use it...

Contact Who made it...

1.2 What is it?

Sufferer

Sufferer is a file suffix renamer.

It allows the mass-renaming of file extensions, so if you've got a load of JPEG files with a .jpeg extension, you can change the .jpeg to .jpg for example. Or you could turn loads of .txt files into .readme files, for the sake of continuity, and so on...

IMPORTANT NOTE! See the Icon section of Usage!

1.3 Usage

Usage

Just run it from WB or CLI (there are no CLI parameters - it only uses a reqtools requester).

Just select the files whose suffixes you want to change, using the reqtools multi-select requester. Enter a pattern into the pattern gadget (eg #?.iff) to make your selection easier if you want.

Note that, for conservation of memory reasons, you can only select 1000 files at a time, good enough for most people, but not so good for animation freaks I guess. If anyone needs more, either modify the supplied Blitz source, or contact me to compile a bigger version.

Then just enter a new extension for your files (it doesn't matter if you supply the "." or not, as the program will check for you).

IMPORTANT! - There's a bug in one of the Blitz commands, which means that if you cancel the suffix requester, or enter an empty string, you get an Enforcer hit. To avoid this, type Abort (set up by default) and click OK if you decide to cancel the renaming process. Sorry!

Icons

By default, the file requester only shows your files. If your files have icons attached, you must click on the [.info] gadget in the file requester to be able to select the icons as well!
