Introduction to the Value Converter

Credits of the model

Introduction

The Value Converter is a simple demonstration of how to convert a variety of values to a format specified by the user.

The user enters a value, and then specifies the format which the input should be converted **to**. The model assumes that the input is in the **opposite format** to that which the output should be converted to.

This is Version 1.0 of the **Value Converter**. Copyright ©1995, belongs to Craig Ward. All Rights Reserved.

Craig can be reached at 100554.2072@compuserve.com
