

PG_URLDrop_Class (1.0)

freeware

This class gives all objects, which are containing a drag & drop functionality, the possibility to read out the content of the following file types:

These file types contain data for a URL, mail address or an FTP connection.
If you want to use the PG_URLDrop_Class, put it into your project.
After you have included the class, create 4 new file types for your project:

- | | |
|---------------|------------------------------|
| 1.) MAILDrop: | Creator: "drag" Type: "ilma" |
| 2.) HTMLDrop: | Creator: "drag" Type: "ilht" |
| 3.) FTPDrop: | Creator: "drag" Type: "ilft" |
| 4.) NSDrop: | Creator: "MOSS" Type: "URL " |

For preparing an object put the following code snippets into the different handlers:

Open:

```
dim URL as PG_URLDrop_Class  
URL = new PG_URLDrop_Class  
URL.set_FileTypes(me)
```

DropObject:

```
dim URL as PG_URLDrop_Class  
URL = new PG_URLDrop_Class  
me.text = URL.get_URLDrop(obj)
```

NOTE:

If you have some bug reports or ideas for more RB-Classes then let us know.
You can contact us via e-mail, the address is mentioned at the end of this documentation.
