Introduction

Fantastic Software

Creating Help files like this one are a real ball ache and often take longer take longer to write than the programs they accompany. Fs Popup was created to "Roughly" emulate that stupid paper clip thingy in MS Word.

I've kept the control as friendly to use as possible. Drop the control onto a form and you will be presented with a small ? in a white box, position this or use the "Alignment" property to do it for you now build your application.
When you have finished goto the "Form_Load" and use the following command to add help messages to your controls :-

FSPopup1.ADDHelp me.Hwnd,"Title Text","And this is the actual 'Helpfull' message attached to the control"

That will assign that message and title to the Main Form, now run your application and double click on the little ?.

A small window should appear, you can reposition and re size the window to suit your needs and it will remember and return to that position next time you run the application.
Now if you move your mouse over the Main Form, your Title and Message will appear in the Window.

ADDHelp

Syntax: **ADDHelp** Hwnd,"Title","Help Description"

This is the main command,and should be placed in the "Form_Load", below is an
example that set's up some help for the Main Form, an Option Button, A Picturebox
and a Checkbox.

FSPopUp1.AddHelp Me.hWnd,"My Fantastic Application","This Program Is Unregistered."
FSPopUp1.AddHelp Option1.hWnd,"Exit","Click Here To Quit"
FSPopUp1.AddHelp Picture1.hWnd,"Quality Artwork","This Is Another Fine Example of Fantastic Artwork"
FSPopUp1.AddHelp Check1.hWnd,"CheckBox","Clicking the square will Put a tick in it"

BackColor

Syntax: **BackColor =** OLE_Color

This is the color of the Background, This becomes irrelivant when a background Picture is setup (Registered Version Only)

BackDropPicture

Syntax: **BackDropPicture =** OLE_Picture

This will set a picture in the background of the help form.
This can be set using the "Custom" Property at design time, when
setup the Help text and Title windows will become transparent.

note. This is only available in the registered version

BorderStyle

Syntax: **BorderStyle =** Borderstyle

Setting this to "1" will enable the the border, this improves the look of the help window when a background Picture is setup (Registered Version Only)

Font

Syntax: **Font =** Font Name

This set's the font of the Title and Help text. Use the "Custom" property at Design Time.

Forecolor

Syntax: **ForeColor =** OLE_Color

This is the text color for the Help Text

OnTop

Syntax: **OnTop =** Boolean

This will force the help window to stay ontop of all others when set to "True"

PopupDelay

Syntax: **PopupDelay =** Millisecond delay before help text

This is just for cosmetic purposes only, I think the whole program looks better with a delay of about 100 milliseconds.

Other Programs/Controls Available

FS Full	Download all my programs, and future software with this program.
FS SysFileMan	Find All OCX,DLL Fonts. You Can move Them To The Correct Directorys, Register/Unregister Or Delete Them.
FS Password	Setup Pretty Good Password Protection In Your Applications. This Does Not Store The Password Anywhere.
