

HelpAgent for Authorware Instructions.

1. Unzip the files into a directory of your choosing. You must have the HADemo.exe, HADemo.u32 and HelpAgent.dll files all in the same directory.
2. Create a subdirectory within the directory where you installed the program files listed in #1 above. Name the subdirectory "xtras". Unzip the xtras into the xtras subdirectory.
3. If you haven't already done so, install the MSAgent control into "c:\program files\microsoft agent" (the default).
4. To hear speech, you will need to install the Lernout & Hauspie text to speech engine.
5. Create a subdirectory within the MSAgent control directory and call it "characters":

c:\program files\microsoft agent\characters

Install your character files (these files have the extension ".acs") into this characters directory...not in the HelpAgent Demo directory! If you haven't downloaded any character files you can get them from MRC Computing's web site (<http://www.mrccomputing.com>).

Note: The demo is fully functional except that you are limited to 7 speech calls. So, in order to get through the demo, you'll have to quit the program and restart it several times to refresh the speech call counter.

Upon purchasing the full retail version of HelpAgent for Authorware, you will be able to make unlimited speech calls in your application and you will receive the source code to the Authorware demo!
