TPSettings Editor Context Help File

Specifies the location in which to store the form or application settings.

Specifies the HKEY under which to save the form or application settings if the save location is the Registry.

Specifies your company name.

If you are saving settings to the Registry, the base key is created as: Software\Company Name\Sofware Name\Software Version.

Specifies your software name.

If you are saving settings to the Registry, the base key is created as: Software\Company Name\Sofware Name\Software Version.

Specifies the version of your software.

If you are saving settings to the Registry, the base key is created as: Software\Company Name\Sofware Name\Software Version.

Displays all of the general information about the form or application settings component.

Specifies the length of the MRU list in number of items.

Selects the TMenuItem to which MRU items will be added.

Specifies that the full path name will appear for all MRU menu items.

Specifies that only the file name portion of the MRU menu item will appear.

Specifies that the MRU menu items will display as much of the full path as possible while staying within the width constraint set below.

Allows you to specify how each MRU menu item will be displayed.

Specifies the maximum width, in pixels, of each MRU menu item.

Allows you to visually adjust the maximum width of the MRU menu items when you have selected the Abbreviated Path display style.

Displays the current MRU-related settings.

Specifies that you want to store the horizontal position of the parent form (Left property).

Specifies that you want to store the vertical position of the parent form (Top property).

Specifies that you want to store the width of the parent form.

Specifies that you want to store the height of the parent form.

Specifies that you want to store the state of the parent form (normal, minimized, maximized).

Displays the settings related to the parent form.

Displays a tree view of all of the parent form's properties, components, and components' properties.

Allows for the selection of items to be stored by clicking to the left of the desired item.

Double-clicking the tree view displays the Quick Selection dialog.   You may wish to use the Quick Selection dialog to select properties for one or more components simultaneously.

Displays a list of the properties that have been selected for storage.

Specifies a setting item which is not bound to an application setting.

Specifies a setting item which is bound to an application setting.

Specifies a name by which you can programmatically access this setting.

Specifies whether this setting item will be stored encrypted.

Selects from a list of application settings.   The selected item is the setting to which the current setting will be bound.

Displays information about form-related and component-related settings.

Displays the list of generic settings.

Adds a new setting to the generic settings list.

Edits the name of the currently-selected setting item.

Deletes the currently-selected setting item.

Displays information about the generic settings.

Allows you to modify all of the setting-related information.

Specifies the location in which to store the form or application settings.

This form allows you to quickly select similar properties of multiple components.

Simply select a component or several components and click the property.   A green checkmark next to the property means that the property is selected for all components.   A gray checkmark means that the property is selected for at least one of the chosen components.

Select one or more components to select corresponding properties.

Allows you to select and de-select properties for one or more components simultaneously.
