

Hello all,

This is a VB code only demo for accessing the default windows screen saver password. Do what ever you want with it, it's FREE needless to say I accept no responsibility for anything.

I would appreciate a mention if you use this in any of your projects or any useful tips tricks or code that you think may be of use.

Does anyone know a solution to the following.

I am trying to extract bitmaps from VBX's on the fly, but the ID of the bitmaps within the resource is unknown at runtime. I thought they would have all started from 8000 but some people just seem to use any number. I know this is possible otherwise the VB toolbar couldn't display them, if anyone knows how, I would appreciate a clue.

Have fun
