

## Visual Basic List

The program reformats Visual Basic 2.0, 3.0 & 4.0 Source Files saved as text, where appropriate, such that the indentation of source lines reflects the logical structure.

To illustrate :

Before

```
Sub Fred (x%, y%, z%)
If x% <> 0 Then
If y% = 0 Then
z% = x% * 2
Else
z% = x% + y%
End If
Else
z% = 0
End If
End Sub
```

After

```
Sub Fred (x%, y%, z%)
If x% <> 0 Then
    If y% = 0 Then
        z% = x% * 2
    Else
        z% = x% + y%
    End If
Else
    z% = 0
End If
End Sub
```

The number of spaces per indent level can be selected in the range 0 to 5.

The indent level changes are defined in a file VBList.BNF.  
Contact the author for details.

**Please Note:** VBList works only with VB 2.0, 3.0 & 4.0 source files in text format
