

Finger  
(C) InterNetwork Ltd

This is a little finger program that does the usual. You enter a user name (optional) and a host name (mandatory). You click on finger and it fingers! The long report check box inserts a /w token on the send stream to get the maximum level of verbosity from the finger daemon.

I wrote this mostly as an excersise in using the recv function and using dialog boxes as main windows. Its a freebie to all trumpet users as thanks for the wonderful winsock Peter has written. It was written in Borland Pascal v7.0 using trumpet winsock.

Known bugs : Sometimes if you click finger twice it will refuse to connect a second time. Just retry and it will work.

Future enhancements : I'll think about it

Comments and bugs to : [ace@ics.forth.gr](mailto:ace@ics.forth.gr)

Coming Soon : Telnet

Coming later : NFS server and client.
