1.2 Startup

The program may be started either from CLI or from WorkBench

The CLI parameters are

CO=CONFIG/K,SI=SLEEPICON/K,

where CONFIG represents the name of the configuration file (defaults to PROGDIR:ZVT.Settings) and SLEEPICON the name of the icon file (without .info) for the 'sleeping' image. (defaults to ZVTSleep)

The ToolType parameters CONFIG and SLEEPICON are also used for the configuration file and the sleeping image when started from workbench, but the difference is that the sleeping image defaults to the program icon.

1.3 ZyXELVoiceTool

```
Menus
Main window
Call receiver...
Setup...
Progress...
```

1.4 Main window

This window contains all mostly used gadgets.

```
Temp options
Call options
Record options
Other windows
```

1.5 Temp options

This sub panel has got the following gadgets (from top to bottom):
The settings used for playing and recording are set by the gadgets right to it and in the setup window.

- * Play
Plays the selected temporary file (see below this gadget)
- * Record
Records the selected temporary file.
Does the file already exist, a requester pops up asking about the permission to overwrite it.
- * String gadget
Sets the name used by the two gadgets above. The button right to it opens an ASL file requester.

1.6 Call options

Contains all call options, these are (from top to bottom):

- * Record call
Records the call in progress and inserts an entry in the log list
 - * Answer call
Immediately starts the Call sequence
 - * Answer fax
Starts the ARexx-script for a fax call (if allowed)
 - * Answer data
Answers a data call (if allowed)
-

1.7 Call sequence

A call sequence proceeds as follows:

After picking the phone the outgoing message will be played and checked for DTMF keys and Fax tone.

If nothing happens, the signal will be played and the call recorded.
If there is no noise received ("Silence without voice data" recognized)
ZVT assumes a remote modem and tries a modem connection.

While playing and recording following signals have got this meaning:

- 1) DTMF key described under "Data DTMF key"
Starts the data call sequence (look there)
- 2) Fax tone
Starts fax receiving
- 3) Any other DTMF key
Starts (if allowed) the Remote operation

When entering remote operation ZVT first asks for the password.
Is it correct, the user hears a long signal beep and the first call will be played.
An incorrect password will be acknowledged with three short signal beeps (generally an error signal) and a hangup.

1.8 Record options

Sets the options for recording/playing and the compression.

- * Output device/Input device
Self explanatory. Isn't it?
- * Compression
Sets the compression the modem uses when recording.

ATTENTION: The CELP compression is only usable with 'plus' models
and the ADPCM3 compression works sometimes incorrectly, corrupting
the voice file.

1.9 Other windows

These buttons are for opening other windows for settings and the call receiver.
The check mark below switches the call receiver itself on and off.

Setup...
Call receiver...

1.10 Status line

Used for status messages.

1.11 Call receiver...

This window consists of three parts:

- Call list
- List options
- File names

1.12 Call list

This is a list of the incoming calls.

From left to right the columns have got the following meaning:

Date and time: Point of time when the call is received or has been recorded.

Type : 'V' - Normal voice call
'F' - Received fax
'D' - Data call

Length : Duration of call in seconds

1.13 List options

This group contains all operations being performed on the call list left to it.

* Play call
Plays the selected call.

This function is also used when double clicking an entry in the list.

* Archive call
Deletes the selected list entries, but does not delete the associated files.

* Delete call
Deletes the selected list entries and the associated VOICE(!) files.

* Archive all
Deletes the complete list but not the files.

* Delete all

Deletes the complete list and all associated Voice files.

Files associated to type 'F' and type 'D' calls remain untouched.

1.14 File names

Used to set file names like

- * Outgoing file
Sets the file to be played before the message is recorded.
- * Log file
Sets the file where the log ist is saved.
- * Incoming file prefix
Sets the prefix (and the path) of the file names of the incoming files.
Be aware that ZVT uses twelve characters to uniquely identify the incoming call and the DOS supports file names up to a length of thirty characters.
The means, the file name part must not be longer than eighteen characters.

1.15 Setup...

The pages mentioned below are used to view/change general settings.

The settings are normally loaded from the file PROGDIR:ZVT.Settings when no other file is specified at startup.

- Modem
- Remote operation
- Batch files
- Voice settings
- Save/Load

1.16 Modem

- * DTMF key
When this DTMF key is recognized, the call receiver switches into data mode.
 - * Toll option
When enabled, the call receiver waits four rings before answering the first incoming call and two rings before answering all other incoming calls.
 - * # of rings
If the 'toll option' is disabled, this slider sets the number of rings to wait for before the receiver answers the call.
-

* Device name

Used to set the device name the modem is connected to.
Defaults to 'serial.device'.

A change of this parameter and the unit number
will be only recognized when saving the file, exiting and restarting
the program.

* Unit

Normally zero, used to set the unit number to be used when opening the
serial device (may be used for multiseriial cards ect.)
When in doubt about this and the above parameter, check out the
manual for your serial I/O card.

1.17 Remote operation

Sets the remote options.

* Remote operation

Main switch for the remote operation.

* Password

Sets the password for the remote operation

IMPORTANT: Don't use passwords with equal digits directly following.
These are filtered out of the input stream to make the typing of
the password less difficult when using a ZyXEL with an older
ROM version.

When there is no key recognized withing five seconds, the program
assumes a hangup and stops the remote operation.
After recognizing a key you should hear a short beep as an acknowledge.

* Functions

The number pad and the gadgets left to it are used to set which
remote operation is put on which DTMF key.

Functions...

Number pad

1.18 Functions...

The text gadget below shows which key is used for the currently selected
operation.

Using the number pad right to it, you can change the settings.

1) Replay call

Plays the last played call once more.

- 2) Next call
Plays the next call in row. If there are no more calls you will hear the three short beeps.
- 3) Previous call
Like 2), but this time the previous call.
- 4) Delete call
Deletes the last played call.

1.19 Number pad

Use this number pad to set the DTMF key for the currently selected function.

Watch out that you don't use a key for two functions or the first function will be used.

1.20 Batch files

This group is used to set the ARexx scripts this program uses and whether the function in question is enabled or disabled.

A released button and a 'ghosted' string gadget means that the specified function is disabled.

The functions are as follows:

* Fax ARexx

Means the ARexx script called when this program detected a fax call.

At startup of the script the phone line is already opened, but the modem didn't start with the fax carrier negotiation.

The fax program should start at that point where it should start when the phone is ringing and the serial device MUST be opened in SHARED mode.

* ViewFax ARexx

Sets the ARexx script used when you try to view a fax with using the "Play call" button in the receiver section.

* Data ARexx

Started when a data call is received.

This script will be started when (and only when) a CONNECT is established. That means, the script does not care about the phone answering and can start with the login for the user.

* Call ARexx

Currently unsupported, but in future versions this will be used as an exchange for the normal call procedure.

* Baud rate

This gadget is only visible when data calls are enabled (see above)
It sets the baud rate used for the carrier negotiation.
The program used in the ARexx script to handle the serial device
must be set to EXACTLY the same baud rate and must open the serial
device in SHARED mode.

1.21 Voice settings

These slider gadgets are used to set some parameters concerning the voice
file recording.

* Duration

Sets the duration of the call in seconds.

The duration of the call relates to the size of the file like following:

CELP : size = secs*1200

ADPCM-2: size = secs*2400

ADPCM-3: size = secs*3600

It may be important when calculating the used HD space.

* Silence level

Sets the silence sensitivity in tenth of dB.

The higher the value, the less sensitive the modem is to noise.

A too high value may result in an end of recording because a normal
speech volume would be counted as 'silence'

* Silence duration

Sets the minimum duration of the silence interval in tenth of seconds.

Setting this to zero would turn off the silence detection, which
is NOT recommended, because recordings would be done over the maximum
length and data calls would only be recognized if the remote modem
sends the DTMF key.

Setting this to a low value a normal halting in speech would result
in an end of recording.

* Signal tone frequency

Sets the pitch of the signal tone in Hz.

* Fixed volume level

When this checkmark is enabled, a fixed scaling will be used when
converting from ADPCM to IFF.

When disabled, a first scan will be used to determine the volume level
of the voice file and scale up or down for a best fit.

The disadvantage is that the conversion would take twice as long
as with a fixed level.

1.22 Group

Used to set the name of the configuration file saved and loaded with these two gadgets below.

1.23 Speichern/Laden

According to the pressed button the configuration file named in the string gadget above will be loaded or saved.

1.24 Progress...

This window only appears when a voice file is played or recorded via modem.

There is a "STOP" gadget rendered, but a mouse click ANYWHERE will result in the operation aborted.

I've done it because the checking of the gadget is too time consuming (at least on an Amiga 2000 :- ()

1.25 Menus

- * Project
- * Info
 - Opens up a requester with a short remark.
- * Quit
 - Self explanatory
- * Conversion
- * ADPCM -> IFF
 - Converts the current file from ADPCM into an IFF-8SVX file to be chosen by a requester.
- * IFF -> ADPCM2
 - Converts the current file from an IFF file - chosen by a requester - into ADPCM-2
- * IFF -> ADPCM3
 - Converts the current file from an IFF file - chosen by a requester - into ADPCM-3

1.26 current file

In the main window it means the temporary file, in the call receiver window it means the currently highlighted call.

1.27 Bugs

Pressing the DATA/VOICE key on the modem may screw up the program.
When accepting a data connection, press "Answer data" instead.

Report problems with filling out the bug report form
and send it to me .

1.28 ARexx Commands

Additional to the ever-present MUI ARexx commands
there are the following commands:

Following commands are equivalent to the pressing of the similar gadget and
are operational when the program is waiting.

- * answercall
Starts the Answer sequence
- * recordcall
Starts the call recording
- * answer fax
Transfers control to the fax script
- * answerdata
Starts the data call sequence
- * receiveron
Switches on the call receiver
- * receiveroff
Switches off the call receiver
- * playtemp
Plays the temporary file
- * recordtemp
Records the temporary file.
Does the file exist, a requester pops up asking for the permission
to overwrite the file.

Following commands are used for transferring parameters to and from the
program. 'setxxx' sets the parameter and 'getxxx' puts the parameter into
the RESULT variable.

- * setlength/getlength
Sets/gets the duration of the call in seconds
 - * setname/getname
Sets/gets the name of the file associated to the call.
 - * settype/gettype
Sets/gets the type of the file, where the letters have got the following
-

meaning:
'V' - voice file,
'D' - data call,
'F' - fax call,
'X' - empty call. The caller seems to hung up as he heard the outgoing text.

* settname/gettname
Sets/gets the name of the temporary file.

1.29 MUI ARexx commands

Every MUI application is able to receive commands via the built-in ARexx port. Here are some default commands which are understood by every program:

- QUIT

Ends the application.

- HIDE

Hides (iconifies) the application

- SHOW

Shows (pops up) an iconified application.

- INFO ITEM/A

According to the given parameter the result string is filled with the following contents:

- "title" Title of the application
- "author" Author of the application
- "copyright" Copyright message
- "description" Short description
- "version" Version string
- "base" Name of the ARexx port
- "screen" Name of the public screen

- HELP FILE/A

A list of all ARexx commands available for the application is written into the given file. In addition to the default commands an MUI application can (and of course should) support many application specific commands. The help list will contain these commands as well.

In case of an error, MUI returns the following values to the rexx script:

- -1

Wrong command definition in host program. Should never happen.

- -2

Out of memory.

- -3

Unknown ARexx command.

- -4

Syntax error.

Some example scripts can be found in the 'Rexx' drawer on the main directory of the distribution.

1.30 Requirements

This program needs

- * An Amiga computer :-)
- * OS 2.0 or higher
(use of different languages needs at least 2.1)
- * MUI 2.3 or higher
MUI? What's that?
- * A ZyXEL-Modem with at least 5.02 ROMs
(Use of CELP compression requires a 'plus' model)
- * Around 2 MB free RAM
This is the extreme case, because the voice data are put in RAM first.

1.31 What is MUI?

(Excerpt from the ReadMe file for MUI)

MUI - MagicUserInterface

Version 2.3

(c) Copyright 1993/94 by Stefan Stuntz

- ShareWare -

MUI is an object oriented system to create and maintain graphical user interfaces. From a programmers point of view, using MUI saves a lot of time and makes life much easier. Thinking about complicated terms like window resizing or font sensitivity is simply not necessary.

On the other hand, users of MUI based applications have the ability to customize nearly every pixel of a programs interface according to their personal taste.

This distribution is interesting for both, users and programmers. Please have a look at the supplied demo programs and at the documentation to see what MUI has to offer.

1.32 What is ZVT?

ZVT is short for "ZyXELVoiceTool", a program to use the voice mode of your ZyXEL modem.

It is a call receiver providing an interface for fax or data calls. To read how a call is processed, look for Call sequence .

The use of the "Magic User Interface" makes the program easy to use and the GUI freely configurable and offers an ARexx port.

ZVT has got the following features:

- * Graphic User Interface (MUI)
 - * Iconifying (and freely selecting the iconify icon)
 - * Different languages (English and German so far)
 - * Remote operation
 - * Freely settable remote operation keys
 - * Acknowledge for every recognized key when entering the remote operation password
 - * Transferring control to a fax program if a fax is detected
 - * Transferring control to a BBS program or such things if a data call is detected
-

- * Convert ADPCM files to IFF and vice versa
- * Recording from phone line or external microphone
- * Playing to phone line, Amiga speaker or modem speaker
- * Toll option
- * Incoming calls logged. Double clicking an entry plays a call or shows a fax
- * ARexx commands for the most important functions

1.33 Why ZVT?

Up to this time I know only two programs usable as a call receiver for my ZyXEL modem, but both of them didn't fit my needs.

When a feature is implemented in the first program, it lacked in another, and one of them had a bug when recording voice data, while the other needed a DTMF key for a data connect, meaning for the caller to adapt the dial string. :-)

The only way to change the situation is to write a program from the scratch, and ZVT is the result of my effort.

I hope it will satisfy YOUR needs, too.

1.34 Author

1.35 Thanks go to...

Mainly to my friend Rene Wangert, testing the option "Data call" repeatedly...

1.36 Copyright

© 1994-995 by Carsten Pluntke,
all rights reserved.

That means, I'm ruling the distribution and usage as follows:

- This program is SHAREWARE , that means that you can test it for 30 (in words: thirty) days. After this period you either have to register yourself or stop using it.
 - The archive containing the unregistered version may be redistributed via BBSes, on disks or other ways you can imagine (I want you to do it!), but for REASONABLE media costs. (\$5 for a disk are too much)
 - Inclusion in commercial programs requires the expressed written consent by the author.
 - Spreading through PD series is allowed only if the price of the sold media (mostly disks) doesn't exceed REASONABLE costs and/or the vendor doesn't get any real income by selling it.
 - The registered version of this program is exclusively for the personal use by the person who registered it and is NOT to be redistributed.
 - In this distribution no file has to be changed, omitted and/or added.
-

! This includes the BBS ads most BBSes add to the archives passing
! through. The SysOp is responsible for deleting these files
! being automatically added.

But I want to be fair and I'm allowing one (1) BBS advertising
in this archive because really good BBS software has to be able to
delete alien BBS ads before adding the own.

If this happen to me to find an archive with more than one BBS
ad, the SysOps of the systems having added the second, third... ad
will be held liable for that.

THESE ARE NO EMPTY WORDS!

- Executables must not be disassembled, resourced or re-engineered in any other way imaginable. Furthermore, these must not be patched, either on the storage media, before starting or while running.

1.37 BBS ads

Okay, now it's not as bad as it was, but frequently I see archives with five or more BBS ads in it.

It is simply annoying if the advertisements are placed in the same directory together with the program, and

- I generally don't read this junk because even PD (!) programs seem to pass through those (what a joke) "ELITE-BBSes", which don't reveal their numbers, leaving only crap in these files.
- the names are garbled with shitloads of control characters, so that you can't type the name correctly and risk with a 'delete foo#?' the deletion of important (I mean program files) files.
- they are often disguised as a 'ReadMe' or 'Important' ASCII file overwriting the REAL 'ReadMe'-File on extraction
- they use storage space - even when archived.
- they aren't only ASCII files, sometimes I saw an IFF-ILBM picture or even an executable (whoopsy - maybe i caught a virus?).

As a program author I want to protect my potential users. BBS advertisements may be found in other archives more than enough. First every change of the archive may damage it (yes, it happened...) and second I've put enough work into my program to be REALLY annoyed when some BBS SysOps use it for cost-free advertising and maybe even getting PAYING users... :-(

1.38 Shareware

I've put enough work in it and maybe I'll do in in future - enough work that this program is too elaborated to put it in the Public Domain, so I decided to want a shareware fee of 20.- DM per registration.

The difference between the registered and unregistered version th that

the latter doesn't record more than two calls in the log list - the third call won't be answered.

If you want to register yourself, send me the Form per EMail (or per snail mail) and the money enclosed in the letter or place it on my Bank account .

Normally you'll receive a disk with the last version of the program but you may receive it PGP encrypted via EMail, if you want to.

If there is an Update available, you can send me the old program disk along with 3.- DM (if this is a minor update, requesting no update fee) and you'll get the new version sent back.

If you received the program PGP encrypted via EMail, I will do it again and don't expect a fee.

1.39 Registration form

ZVT x.x registration form

1.41 Disclaimer

Disclaimer
=====

THERE IS NO WARRANTY FOR THE PROGRAM, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDER AND/OR OTHER PARTIES PROVIDE THE PROGRAM "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE PROGRAM IS WITH YOU. SHOULD THE PROGRAM PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY REDISTRIBUTE THE PROGRAM AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE PROGRAM (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE PROGRAM TO OPERATE WITH ANY OTHER PROGRAMS), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

To be short: It works on my machine. Don't know about yours.

1.42 Online

When running the program, pressing the HELP key opens a document page for the gadget the mouse points to.

But the problem is that the help file is always named 'ZVT.guide', so that you should rename the document for your favourite language to that name.

1.43 History

V1.1 (22-02-95)

- * Bug fix:
The program failed to work if some program used the command ATE0 to switch off the command echo.
- * Found (and fixed :-) a nasty bug that would have deleted the last voice call if somebody tries to receive a fax or data call directly using the buttons.
- * Added 'X' as a call type.
- * The log list is now sorted correctly -- most recent call first.
- * Modem type and ROM version checking included.

V1.0 (29-01-95)

First public release
