General information

Only the executable is required to use World Time for Windows.
Before using any new piece of software, it is always advisable to make a complete backup of your hard-disk (or at least all the non-recreatable files).
You should now use the File Manager or Program Manager to add World Time for Windows to one of your application groups. If you do not know how to do this, please refer to the Microsoft Windows Version 3 User's Guide, Chapter 3: Program Manager, Changing the Contents of Groups (pages 88 *et seq.*). You should now set the TZ (time zone) environment string for your area as detailed in "Setting the TZ Environment String" below.
To start the program, simply double click on its icon. The following window should appear:

Initially the time in London, United Kingdom is displayed. Selecting the Location item on the menu bar displays a list box containing other locations:

Select any location by clicking on it and pressing the OK button (or simply double click on the location). The display in the main window changes to reflect your selection. In this release, over 80 locations in 23 countries are included. World Time for Windows knows about every state capital in the United States. Support for Daylight Savings Time (DST) is also available through the MS-DOS environment string TZ (see below). You may have multiple instances of World Time for Windows, so that the time in New York, Paris, and Moscow could be on the screen before you . The number of instances is limited by the number of timers available in Windows. The maximum in this version of Windows is 16.

Setting the TZ Environment String

set TZ=GMT0BST

This information is correct for the British Summer Time in the United Kingdom. If you are elsewhere, the format will be different. The format of the TZ environment variable is:

TZ=zzz[+/-]d[d][lll]

zzz represents the name of the current time zone (e.g. GMT, EST, PST, etc...)
[+/-]d[d] is an optionally signed number with one or more digits. It represents the difference between the local time zone and GMT in hours. Positions to the east will be negative, whilst those to the west are positive. So that continental Europe will be -1, EST will be +5 and PST will be +8.
lll is optional and represents the local time zone Daylight Savings Time. You can put any string you like here; it simply increments the hours by one. If this field is not set, the hours will not be incremented. Examples:

Location
Daylight Savings Time
TZ Setting

New York, NY, USA

	No
	EST5
New York, NY, USA	
	Yes
	EST5EDT
Los Angeles, CA, USA	
	No
	PST8
Los Angeles, CA, USA	
	Yes
	PST8PDT
Paris, France	
	No
	GMT-1
Paris, France	
	Yes
	GMT-1DST

For further information on how MS-DOS handles time settings and time zones, you are referred to the Library Reference manual for a C compiler (i.e. Borland C++ 2.0 Library Reference).
