

Helping Children Learn to Add

An Application for the Macintosh

by
Mike Kazmierczak

The adding game is an application to aid children in learning to add. Problems on varying levels of difficulty are given and the child is given two chances to give a correct response. Four levels of difficulty are provided; Easy, Medium, Hard and Very Hard. The maximum values of the addends are 5, 8, 11, and 14 respectively. Using the Macintosh Speech Synthesizer (Apple Computer, Inc.), the computer speaks both the problem, answer, and a random phrase indicating whether the correct answer was given or not. Macintosh can be obtained from most bulletin boards or from dealers. If Macintosh is not installed, then chords are played to indicate a correct (high) or incorrect (low) answer.

Once launched, the program follows the Macintosh interface and has only two options. Add (command-A) allows the shareware information to be displayed. Quit (command-Q) exits back to the Finder. To change levels of difficulty, just click anywhere in the left window to activate it and restart.

This program is shareware, and as such, no fee shall be charged for its distribution, nor shall it be offered as an inducement to buy other software or hardware. If you find this software useful and decide to keep it, please send \$5.00 to me at
