

## Version History

### Version 5.31 (26 Oct 1991)

- Because of the new conversion application, all key code dialogs were removed from the Control Panel.
- This new documentation was included due to complaints about the lack of documentation outside of the Control Panels help.

### Version 5.4 (10 Nov 1991)

- You can now select multiple key combinations as the modifier keys to access the pop-up menu.
- AutoMenus now ignores everything to the right of the last menu in the menu bar (except for the balloon and application menus). Because of this, the "Using Menu Clock" checkbox is no longer needed in the options dialog.
- Redesigned dialogs.
- Performed some general maintenance on the extension code.

You might notice that Balloon help is no longer available in the Control Panel. Balloon help will not be available again until a more convenient method is developed for writing it.

### Version 5.5 (21 Nov 1991)

- New Auto Termination feature incorporated at the request of many.

### Version 5.51 (6 Dec 1991)

- Made changes to reflect new order address.

### Version 5.52 (21 Dec 1991)

- AutoTermination would reset to 0 after restart. Fixed.
