

11 Future Plans

SimpleWave was written because I needed it myself and needed it to be ready for use in a short period of time. From early alpha-versions on I've been using it. However, this means I didn't spend any time writing an "Administrator application" to change the resources. You need to change them manually right now. I am sorry about that, but for the moment I have no plans to start working on it. SimpleWave is written in Pascal and I will port it to C as soon as possible. After that I may start working on an Administration application.

The following things are planned to be implemented, sorted from high to low priority:

- Port the code from Pascal to C and compile PowerPC native code as well.
- Add application which causes all copies of SimpleWave on the network to recheck the harddisk. (bought Inside Macintosh Interapplication Communication for this...)
- Welcome message.
- Log file.

If you have other wishes and suggestions please contact me. Use the Feature Request Form in this manual to submit feature requests.

Remember, all these plans depend on the support I get from users! So please register your copy of SimpleWave!
