• CAUTION - READ THIS PARAGRAPH CAREFULLY BEFORE USE! •

Like most other software vendors, I do NOT guarantee that SndControl will work correctly on your Mac.

Lots of users have reported satisfaction from around the world and I have never lost any data because of it. However, please test SndControl carefully on your own system and with your usual set of Control Panels

and Extensions (aka INITs), before using it while doing productive work and of course, do save your documents as often as possible while you work (but you do that anyway, don't you?).

SndControl REQUIRES that you run your Mac under System 6.0.4 or higher.

Version 2.2.1 was developed and extensively tested on a PowerBook 170 running System 7.0.1 & Tune Up 1.1.1, so I know it works fine under that environment. I

developed and tested 2.2.2 on a Ilvx and a PowerBook 180, both running System 7.1. Balloon Help and aliases are supported.
