ITC Stone® Family Revisions

1987

• ITC Stone Serif, ITC Stone Sans, and ITC Stone Informal first released by Adobe.

1989

• Support of Apple's® NFNT format (minor revision).

1990

• Improved font rasterization (minor revision).

1992

• Changed the style-link associations in the PC product to correspond to those in the Macintosh® product, and made the menu names the same for both platforms.

• Corrected the shapes of the Icelandic characters.

• Standardized the underscore, bar, and broken bar.

• Removed the underlines from below the ordinals.

• Made minor improvements to the positions of various accents.

IMPLICATIONS OF 1992 CHANGES

This reconciliation should enable documents composed on one platform to be opened on the other without requiring respecification of the fonts. When you install the new typeface versions, respecify the fonts in documents composed with one of the old typeface versions. Fortunately, none of the changes made to the typefaces will affect character spacing or line wrapping in your existing documents.

If you are a service bureau printing jobs for the public, keep your old set of bitmaps for customers who have not yet upgraded. Note that on the Macintosh platform, the same NFNT identification numbers apply to the old and new versions, so be careful not to use both versions simultaneously. If you're an individual end-user, discard your old versions and replace them with the new ones.

Many applications offer semi-automatic font respecification, enabling you to search and replace by font name. This greatly simplifies the process of converting documents formatted with the old typeface versions. Example: On the Macintosh, if a document contains ITC Stone Serif Semibold, you would search for Sb 1 Stone Serif and replace it with Stone Serif Semibold. Consult your application software documentation to see if your application supports this feature, or to obtain further information about font respecification.
