Using FontPorter™ with System 6

If you have System 6 and don't want to bother using the Font/DA Mover utility to load your fonts, you can copy Adobe's FontPorter (found on the Adobe Type Manager™ 2.0 and higher disk) into the System Folder of your Macintosh and then drag up to 12 different font suitcase files into the System Folder. When you restart the computer, the fonts will be installed.

1 Copy FontPorter into the System Folder.

2 Copy up to a maximum of 12 suitcase files into the System Folder.

3 Restart the computer. Every time you start the computer, FontPorter will look into the first 12 suitcases in the System Folder and add those fonts and sizes to your font menus automatically.

Note: *A suitcase file that contains the Chicago font will not load.*
