

Installing Fonts Into OS/2 2.0

This document explains how to install Adobe typefaces into the OS/2 desktop. You can install fonts into OS/2 directly from anywhere on the desktop.

To install fonts:

1. Click anywhere on the OS/2 desktop using the right mouse button—the desktop displays a menu.
2. Choose Open/Settings.
3. Select Change Font. This displays the Edit Font window.
4. Click Add. In the window that displays next, type in either the designation of the disk drive where your fonts disk is, or the path where your font files are located.
5. Click Add. A window displays a list of available .afm files.
6. Select the files you want to install. As you click, the window next to the .afm list displays fonts available for installation.
7. Click Add. Your fonts will install.

For Rev. 3 fonts, you can install directly from the Fonts disk. However, Rev. 1 and Rev. 2 fonts come on separate diskettes. In order to install them, you must copy all font files to the same directory or the same disk. To do this, copy your .afm and .pfb files to a temporary directory or a single diskette and install from there.

Note: Rev. 3 fonts usually come on one font diskette. Some Adobe Rev. 3 fonts have more than one font diskette. These packages are:

- Adobe Plus Pack (2-3.5" and 1-5.25" diskettes)
- Adobe PostScript Cartridge (3-3.5" and 2-5.25" diskettes)
- Adobe Type Cartridge 1 (2-3.5" and 1-5.25" diskettes)
- Adobe Type Cartridge 2 (2-3.5" and 1-5.25" diskettes)
- Adobe Value Pack (2-3.5" and 2-5.25" diskettes)
- Adobe Type Basics (3-3.5" diskettes)

When installing these packages, follow the directions outlined for Rev. 1 and Rev. 2 fonts.
