

DADDY LONG-LEGS SPIDER

The Latin name for this spider is *Pholcus phalangioides*.

This spider has an oval body, which can be up to 19mm long, with extremely long thin legs. It is greyish-brown, with yellow marks.

Its web is very untidy and is spun in the corners of sheds and rooms, where the spider sits upside-down waiting for prey.

This species is also known as the Cellar spider, which indicates one of its preferred habitats.
