

**Recommendation Q.783****TUP TEST SPECIFICATION****1 Introduction**

This Recommendation contains a set of detailed tests for the Signalling System No. 7 Telephony User Part (TUP). These tests are intended to validate the protocol specified in Q.721-Q.724 Recommendations. This Recommendation conforms to Q.780 Recommendations which describes the basic rules of the test specification.

**2 General principles of TUP tests**

The TUP tests aim at testing TUP protocol conformance in a given implementation. The tests are described as “Validation” tests or “Validation” and “Compatibility” tests. Each test description indicates in the field “type of test” whether the test is “Validation” or “Validation” and “Compatibility”. As the TUP also describes the required call control actions resulting from TUP message transfer the TUP tester also checks the result of those call control actions, e.g. that speech/information transfer is possible.

**3 Test configuration**

A stable signalling relation is required between “SP A” and “SP B” in order to effectively test the TUP. In addition telephony circuits are required for some of the tests.

**4 TUP test list**

All tests may be validation tests. Tests marked “\*” are compatibility tests. Tests marked “fs” are for further study.
