

But usually the best method for getting a target is ordering from Wolf Faust or one of many prepress/DTP suppliers available. Also, software makers for scanner calibration on the PC and Mac (ColorBlind, Heidelberg CPS) usually sell separate IT 8.7 calibration targets.

Beside the manufacturers of the targets for whom you should have no problems finding their addresses, below some normal dealers for IT 8.7 calibration targets (please report your source if not listed here).

Note: Sometimes manufacturers do not ship the reference files with their calibration targets and you have to download the file for the batch of your target from their Internet site (Kodak seems to do this). Also, reference files are usually shipped on Mac or PC formatted floppy disks. So you must be able to transfer the reference files to your Amiga (email me if you don't have any way to get the file transferred to your Amiga).
