

This example shows the TPTShellTree, TPTShellList, TPTShellCombo and TPTSplitter controls working together to give an Explorer-like interface.

Note the right-click popup menus and status line hints for these menus. The controls detect filesystem changes and update themselves automatically (optional behaviour).

Features include separate 'item' and 'control' popup menus for both the TPTShellTree and TPTShellList components. See them in action by right-clicking an item in the list, then right-clicking on part of the list with no item.
