

The SHBrowseForFolder function provided by Windows is a way of selecting a folder. Unfortunately it is very limited and inflexible. The Shell Control Pack includes a replacement for SHBrowseForFolder with features such as resizeable frame, optional Create/Delete folder buttons, context menus and folder renaming.

You can set at which folder the dialog should start with the **BaseFolder** property. Use the "Set base folder" button to change the starting folder, then click

As with the open dialog, the folder browse dialog is available as a component or as a form, allowing you to customize it by adding controls or modifying behaviour with **visual form inheritance**.
