NeXT System Administration Release Notes: The Keyboard Application

This file contains release notes for the Keyboard application (located in **/NextDeveloper/Demos**).

New Features

The following new features have been added to Keyboard since Release 3.2:

· Keyboard now supports the assignment of sequences of keys to individual keys.

· Keyboard is now localized.

Bugs Fixed in Release 3.3

These bugs have been fixed:

· You can now drag and drop characters directly onto the large keycap in addition to dragging

onto the keyboard.

· Double-clicking on keymapping files would sometimes cause a blank keymap to come up and then Keyboard would spin or crash.

· Revert to Saved left the window in an inconsistant state if modifer keys were enabled.

· You couldn't make a key into a dead key.

· Keyboard always started its open panel in **~/** rather than **~/Library/Keyboards**.   It now uses the current document as the directory to start from and **~/Library/Keyboards** if no file is open.   The Save panel also starts in a more rational location.

· The key inspector area of a document would flash horribly when you dragged a character over a keyboard.

· Revert to Saved on a new document crashed Keyboard.
