

# Replacing code sequentially; Replacing code sequentially

- 1 Choose **Edit arrow.eps** [Find arrow.eps](#) [Find Panel](#).
- 2 Type the string of text to find in the Find field.
- 3 In the Replace field type the string of text to replace what's in the Find field.
- 4 Click Next.
- 5 Review the highlighted text in context, replace (or don't replace) the text, and:  
**arrow.eps** [Go on to the next occurrence.](#)  
*Or*  
**arrow.eps** [Conclude the find session.](#)  
*Or*  
**arrow.eps** [Replace all occurrences to the end of the file.](#)

The Find panel differs from the Project Find in a couple of significant ways. It limits the text that it replaces to the file currently displayed in the code editor (or to a selected region). And it allows you to replace code or other text sequentially by highlighting each successive find in the code editor, thereby giving you the opportunity to evaluate the change in context before making it.

[\\_Find\\_Replacing5.eps](#)

Once you begin a search, you have several replacement options at each matching occurrence of text:

[\\_Find\\_Replacing4.eps](#)

You can undo replacement changes with successive Edit arrow.eps → Undo arrow.eps → Undo commands.
