

Verifying compatibility between two libraries;↵Verifying compatibility between two libraries

- 1 Start up the Terminal application.
- 2 Perform the cmpdylib command.

cmpdylib is a verification tool that you can use to make sure you've made the right choices about version numbers. The syntax is:

```
cmpdylib oldLibName newLibName
```

If *oldLibName* and *newLibName* are compatible, this command returns nothing. If they aren't compatible, it tells you why.

cmpdylibWindow.eps ↵

cmpdylib considers two libraries compatible if:

- SquareBullet.eps ↵ They are built for the same architectures.
- SquareBullet.eps ↵ *oldLibName* defines a subset of the symbols that *newLibName* does.
- SquareBullet.eps ↵ *newLibName* defines symbols not in *oldLibName* and has a different compatibility version number.

The two libraries are incompatible if:

- SquareBullet.eps ↵ They are built for different architectures.
- SquareBullet.eps ↵ *oldLibName* defines symbols that aren't in *newLibName*.

SquareBullet.eps –*newLibName* defines symbols not in *oldLibName* and has the same compatibility version number.

Currently, **cmpdylib** only checks C-level API and does not distinguish between public and private API. For example if you add a method, **cmpdylib** won't detect the change. Also if you change a private class, **cmpdylib** will report the change as an incompatibility.
