

Double ended Queues

Dequeues are declared as an "abstract" class. They are currently implemented in two ways.

XPDeque

implement dynamically-sized Deques via XPlexes.

DLDeque

implement dynamically-size Deques via linked lists.

All possess the same capabilities. They differ only in constructors. XPDeque constructors optionally take a chunk size argument. DLDeque constructors take no argument.

Double-ended queues support both stack-like and queue-like capabilities:

Assume the declaration of a base element **x**.

Deque d; or **Deque d(int initial_capacity)** declares a deque.

d.empty() returns true if deque d is empty.

d.full()	returns true if deque d is full. Always returns false in current implementations.
-----------------	---

d.length() returns the current number of elements in the deque.

d.eng(x) inserts x at the rear of deque d.

d.push(x)	inserts x at the front of deque d.
------------------	------------------------------------

x = d.deg()	dequeues and returns the front of deque
--------------------	---

d.front() returns a reference to the front of deque.

d.rear()

returns a reference to the rear of the deque.

d.del_front()

deletes, but does not return the front of deque

d.del_rear()

deletes, but does not return the rear of the deque.

d.clear()

removes all elements from the deque.
