

3.3 Release Notes: GNU Source Code

This file contains release notes for building the GNU projects provided on the *NEXTSTEP Developer* CD-ROM in Release 3.2. There are no changes for Release 3.3.

Known Problems

- If you don't have **bison** already installed then you'll need to make and install it before building the compiler. To do so, **cd** to **/NextDeveloper/Source/GNU/cc/bison** and type **make** (since this directory will likely be owned by **root** you'll need to be **root** to do this). Then type the following commands

```
mkdir /usr/local/bin  (this may already exist)
```

```
mkdir /usr/local/lib (this may already exist)
```

```
cp bison.NEW /usr/local/bin/bison
```

```
cp bison.hairy bison.simple /usr/local/lib
```

- For the compiler project in **/NextDeveloper/Source/GNU/cc/cc**, typing **make** without a target will attempt to do a **make install**, which may overwrite your existing compiler. You should therefore use **make all** instead.
