

Q: How can you add text to the end of a text object?

A: The trick is to make a zero length selection at the end of the text, and add the new text there. The following code snippet illustrates the necessary steps:

```
/* This routine assumes that you have defined currentDocWindow somewhere else */  
  
- addText:(const char *)newString  
{  
    int length;  
    id currentDocText;  
  
    /* Get the current text document */  
    currentDocText = [[currentDocWindow contentView]docView];  
    length = [currentDocText textLength];  
    [currentDocText setSel:length :length];  
    [currentDocText replaceSel:newString];  
  
    return self;
```

}
