(NSString *)expressionValueForContext:(id <EOExpressionContext>)context

Returns the receiver's format string with substitutions made as explained in the class description. Sends the receiver's expression object an expressionValueForContext: message, with context, to get the value to substitute. This method otherwise ignores the context argument.

initWithExpression:expression
format:(NSString *)format
magicCharacter:(unichar)magicCharacter

Initializes the receiver, a newly allocated instance of EOFormatExpression, to substitute expression's expression value within format at each occurrence of a percent sign followed by magicCharacter. This is the designated initializer for the EOFormatExpression class. Returns self.
