

`(void)qualifyWithRelationshipKey:(NSString *)relName ofObject:anEO`

Qualifies the receiver so that it supplies objects based on relName, which is the name of a relationship of anEO (that is, a key of the form used with the EOKeyValueCoding protocol). If the receiver was created with the dataSourceQualifiedByKey: method of the EOMasterDataSources protocol, relName should be the same name used to create it. If anEO is nil, the detail data source typically supplies nothing for example, this is useful for temporarily "turning off" a data source when no records are selected in its master.

Suppose, for example, that an application has a
