

initWithString:type:

Getting data as a type stringForType:

```
initWithString:(NSString *)aString type:(NSString *)typeString
```

Initializes the receiver to contain the value in aString. typeString, if non-nil, indicates the format of the contents of aString for example, "RTF". Returns self.

valueType (EOAttribute class)

```
(NSString *)stringForType:(NSString *)typeString
```

Returns the value of the receiver as a string object in the format indicated by typeString. For example, this code excerpt produces a string in Rich Text Format:

valueType (EOAttribute class)
